rized equipment' is attached to your line, dally useful for checking it any "unauthoexamining in depth each major point along cable, and terminal points along the distriscribers. These facilities include all wire, necessary to distribute telephone service bution plant consists of all of the facilities opposite of its intended purpose.... interpreted to allow someone to do just the which would not be attached at the Central this path from the CO to the subscriber, bution path. In this article, we shall follow from the central office (CO) out to the sub-Office. I suppose this article can also be the route and how it is used. This is espe-Basically, the outside local loop distri-

Note that this article is intended as a reference guide for use by persons familiar with the basics of either LMOSMLT or the operation of the ARSB/CRAS (or hopefully both), because several references will be made to information pertaining to the above systems/bureaus.

Serving Area Concepts (SAC) Plan

In order to standardize the way loop distribution plants are set up in the Bell System of the U.S. (and to prevent chaos), a reference standard design was created. For urban and suburban areas, this plan was called the Serving Area Concepts (SAC) plan. Basically, in the SAC plan, each city is divided into one or more Whe Centers (WC) which are each handed by a local central effice switch. A typical WC will handle 41,000 subscriber lines. Each WC is divided into about 10 or so Serving Areas (depending on the size and population of the city), with an average size of the square miles each (compare this to the

BAND (Rural Area Nelwork Design) plan where often a rural Serving Area may cover 150 square miles with only a fraction of the number of lines). Each Serving Area may bandle around 500-1000 lines or more for maybe 200-400 housing units (bylically a fract of homes).

either of the aerisi or underground type. streets). These distribution cables are different sections of the SA (i.e., certain sidie). These feeder cables surface at a underground (unless it is physically imposcable(s) which contain the wire pairs for to each Serving Area. This consists of premises, but there are still a very large phece lines) are crossed ever into one or each line in the SA, and it is almost always spliced into the premise "inside wire" (W) customer's premises, where they are then end up at the station protector at the cross box (in buried plant). The cable pairs plant), or all a cable pair to service wire phene line) at a pale closure (in aerial residence aerial drop wires (one per distribution cables are then split up into distribution cables (which we will concennumber of existing loop plants using aerial tion cables all the way to the subscriber The modern trend is to use buried distribuseveral distribution cables which handle From the SAI, the pairs (or individual point called the Serving Area Interlace which services each phone in the custrate mainly upon in this article). These lomer's responsibility) (SAI) in a pedestal cabinet (or "box"). tomer's premises (and is also the cus From the CC, a feeder group goes out

Although this is the "standard" design it is by no means the only one! Every telop makes its own modifications to this stan-

In any case, it's what area if serves by its number ... such cables and pairs may be arranged in a some well organized offices, however, the essarily have any special meaning (in The cable-pair number is usually written in riorninal, if can change, and it doesn't necpair number is not concrete -- it is marely from 0000 to 9669. Keep in mind that the ing is different however, especially in older

F1 Access Points

Although the F1 is run underground, there is really not a standard access point down there where a certain pair in a cable can be singled but and accessed (as will be explained next). There is, however, a point above ground where all the pairs in the F1 can be accessed -- this point is known as the Serving Arra Interface (SAI), and it will be detailed fater. In LMOS or other assignment records, the address of the SAI will be listed as the Terminal Acdress (TEA) for the F1 cable transling a certain pair in question; therefore, it is where facility F1 stops.

Underground Plant

The term "Underground Plant" refers to any facilities located below the surface of the earth. This includes truly "buried" cables, which are located 6-or-so feet underground surrounded basically by a conduit and diff, as well as cables placed in underground cement tunnels along with

CRAWLING INTO MANHOLES

other "below-ground" equipment (such as seen in most urban areas). Whereas the first type is really impossible to access (unless, of course, you want to 6g for a day or so and then hack into an armored, jelly-filled PIC cable — then you should take a bit of advice from our resident loky-PIC "Goo" advisor. The Marauder), the latter type can be accessed through manholes which lead to the underground

Manholes

a marbole. The F1 for the SAI nearest the an underground cable location map is the along with others on route to the areas manhole should be found down there between SAI bridging heads until you and the warning signs on telephone poles method. Of course, you can always follow cable), so this is not a very practical or where you can dig without hitting a (usually he will just mark off how far down "cable locater" will be dispatched instead Alert (USA) (at 800-422-4133), but often a acquired from the Underground Service always be available. These maps can be mannoie appearances, although it may not best method for locating cable paths and feeder cable group passes through. Using found along a main street or area where a ("call before you dig", etc.) and the spans Beil System manholes are usually

There are several types of manhole covers, both round and rectangular. The rectangular ones are sometimes just hinged metal plates covering an underground terminal or cable closure, and these are easily opened by one person. A non-hinged one may require two people. Round manhole covers (which, by the

and slide it off life hale. You can use a is pressing up against the cover flange and press down on the bar until the hook used. Put the tool into one of the rim stats 3/4 - 1 inch crowber (hook-side) can be removed. The best way to open a cover is or hex sockel wrench). These cavers are covers which utilize locking balls (these types known as "C" and "O" type manhole are basically at the same, except for the accidentally drop the cover down the hole) way, are round so that a lineman can't side to lift up if there are two of you. You bent spirit/er turn of wrench on the other Marbole cover litterit, although an ordinary the same as the standard "B"."A", and can be removed using a standard crespent Then push or lift the cover a few inches up Deliance Carp. P1S- 49 or 8-type to use a manhole cover litter (i.e., "SA" type covers once the bolls are

"One must use good sense when entering a manhole."

should have no problem with two people, although it can be done along provided you are strong anough.

Once inside, check around for any lest equipment or papers which may have been left inside. Basically, there is really no pair access down those, as it is mainly a place through which the protected locator cables are win and spliced logather. These splice points are usually seared in pressurfed air and waterproof cleaures which protect the open splices from community.

AND CLIMBING UP POLES

down there (other than leading coils, inter-office trurk span (smile hare). you happen to be in a manhola serving an are in a very rural or spopalized area, or which look like metal cylinders) unless you will find any of this special equipment Terminal). However, it's unlikely that you BERT (Below ground Electronics Remote between pairs in prossurized cable). A typcaused by the parastic capacitance or O, I, or N enalog), pair gain systems or dolla carrier equipment (i.e., Tr digital etc. There could even be several lypes of ical underground apparatus facility is the (which help compensate for shurt tosses repeaters, equalizers, or loading coils apperatus cases containing either enalog even sketch or map) the cable distribution the manhale access points in your neigh follow any certain cable. Recause of this near the markole, so it is easy to find and er cables generally are labelled at a point actions sooner or later. P.S. ANI in the 604 NPA varies from CO to CO, but is usually 211 or 116. In some step or x-bar exchanges, it's necessary to put a 1 in front of that.

P.P.S. Anyone else work with 4Tel? 604-381-3717 has one of these versatile line test boxes on il....

The Chip

Dear 2600:

I wish I knew where these rumours—start, but the ICL8038 is still being produced by GE Solid State (formerly called GE/RCA/Intersit). GE Solid State has many regular dealers in both the U.S.A. and Canada. Never mind that the 8038 is also handled by most electronic surplus component dealers. In addition, the 8038 is also manufactured by a campiany called EXAR, who makes it under their part numbers.

XR8038CP, XR8038P, XR8038AP, XR8038ACP, and XR8038AP. EXAR also has many dealers throughout the U.S.A. and Canada. By the way, EXAR is also the manufacturer of the other two most popular blue box chips; the XR2207 and XR2209.

I don't understand why people will pay 8 or up to 15 dollars apiece for these chips through private ads when they are available everywhere for around 4 dollars each.

Rubber Soul Toronto, Canada

Apparently, you've never heard of designer chips, have you?

Another ANI

Dear 2600:

The ANI for the 213 area code (Los Angeles) is 61056.

The Soldier

Congratulations. We've also heard that parts of 213 respond to 1223 for a readback of your phone number. In sections of 213 served by GTE, 114 seems to work. Others we've gotten word of are 290 for parts of filmois, 200-xxx-xxxx for other parts of filmois, 760 for the 408 area code, 300-xxx-xxxx in some areas, 711 in parts of Texas served by GTE, 997-555-1212 th area code 502, 200-222-3222 in

LETTERS

area codes 313, 616, 906, and 517,191# in DMS-100 switches, 990 in the 914 area, and 958 in the New York metro area If you find an ANI, send it in to us!

BLV Tidbits

Dear 2600:

I've been doing some research on Busy Line Verification (BLV). If you remember, BLV is the technical name for an emergency interrupt. The information I have pertains to an AT&T TSPS or inward operator.

An operator cannot make an emergency interrupt without having a customer on hold, with one exception. There is a procedure known as a service test call used to check if the BLV circuits within a TSPS switch are functioning properly. This test is done uithout argone on hold, but every time it is done a message prints on the security printer.

There is a feature which prints call detail for any emergency interrupt which exceeds a preset period of time on the security printer. The threshold can be anything from 0 to 255 seconds. Multiple interrupts on the same call are accumulated, but time when the interrupted party is on buld is not.

The tone generator, which beeps when an operator breaks

in on the line, makes a tone of 440 Hz at a ·13 dBm 0 level. The first tone is 2 seconds and every 10 seconds there is a half second burst.

A TSPS's verification network is limited to 8 NPA's. A maximum of 800 local offices to each NPA can be served by a TSPS for verification (that seems like a lot to ric).

BOC's have the capability to exclude telephone numbers and even whole offices from verification.

The BLV trunk group is always trunk group number 35 in every TSPS office (t thought that was neat).

Unfortunately, AT&T has stopped doing energency interrupts in many areas, recently, due to local operators.

The Zeppelin What's the Point?

Dear 2600:

. This letter won't do any good, but I will write it anyway.

I called several of the BBS's you have listed. Mier a while, I hung up. I don't have time to seriew with them. What is the point? Are the users frustrated backers?

.1 call a lot of BBS's and they are easy to use. My time is too valuable to waste, and even more so when it is long distance to fearn some stupid system just to use a sifty BBS.

OUTSIDE LOOP

Some sample ANI numbers are: 213 NPA - Dial 1223 213 NPA (GTE) - Dial 114 408 NPA - Dial 760 914 NPA - Dial 990

These numbers will vary from area to area, and some areas may not have such a service (in this case, you may have to dial a TSPS operator and have her read eff the number on her ANt panel — in some areas, you may have to say a code word or phrase in order for her to give you the number). In any case, it would be a good kies to ask a lineman or testboard employee for the procedure to use in your area to get ANI, because it's very useful and you'll need it sooner or letter.

or changed, however, so it can't always be local telop sets things up; on the bottom and the high-numbered numbers (also, there may be two distribudistribution pairs are always marked with cross-connect wire can be traced over to pairs on the top! It all depends on how the tion cables, with the low-numbered pairs refled upon to produce valid F2 cable gain can be upset when cable pairs are added assume where the F2 pair is. This order sequence -- this makes it easy to visually pairs and distribution pairs are in the cables are first installed, the feeder ber with a BP in the SAlj; however, when the SAI, so don't confuse an F2 BP numnot recorded in LMOS (the F2 BP is not in number of the cross-connected F2 pair is bive labels. Note also that the binding post F2 pair can be found. These F2 the distribution penel, and in this way, the Anyway, once an F1 BP is tourid, the

They are not stan 12") -- these dosures are clamp pressure enclosed and can be quite large (i.e., 6" point called a "bullet closure" which is fully drop wires coming off them they are spliced spans, and they will not have eny vice. These cables consist of multiple and going to the streets which they sen and the lower (and most often larger) tributed to the subscribors on that street, is usually a great deal larger than the eleclowest cable on the telephone pole, and if terminal (SAI)). The F2 cable is always the cables are other F2's coming from an SAI will usually be the one which is being dissingle pole span. In this case, the top F2 Often more than one F2 can be seen on a tric power distribution cables above it.

Buried 52 plant is similar to aerial, except that the cable is not visible because it is underground. Instead plighting to a pole from the SAI, the cable continues underground. The drop windered after also underground, and the method of breaking them from the distribution cable is similar to that of the serial drop splitter, except it is a small pedestal or box located on the ground near the houses it serves. This address closest to this pedestal is the TCA to the EC.

F2 Cable Numbering

The F2 distribution cable is usually given a 4 or 5 digit number, depending on the office. The first 2 or 3 digits should be the number of the F1 that the F2 was

OF PAIRS AND BOXES AND POLES

branched off of, and the last 2 or 3 digits identify the distribution cable. Example:

F1 Cable F2 Cable 25 2531
This F2 cable came from feeder #25

The cable pair numbers may be set in a similar way, with the last 3 or 4 digits identifying the pair, and the first digit (usually a one identifying the pair as a teeder or a distribution pair. Example:

F1 Cable Pair F2 Cable Pair 25 1748 2531 748 4—signifies F1 (feeder) cable pair

Generally, the F1 cable pairs are numbered higher than the F2 cable pairs, due to the fact that it seeder cable may contain several distribution cables' worth of cable pairs. Note once again that eff of this numbering plan is the standard, and it may be far from real life! As soon as one distribution pair is replaced, crossed over to another feeder pair, or taken from service, the set order is interrupted. In real life, it is most always necessary to get both F1 and F2 cable assignment cata.

Facilities F3-F5,

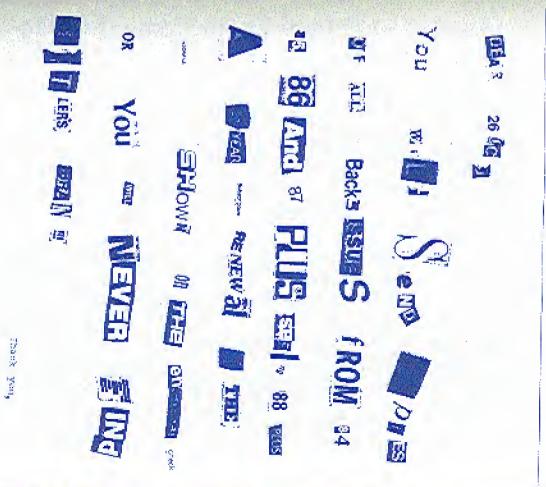

Rural Area Interface (RAI)

Although cable facilities F3, F4, and F5 may be specified in any loop plant, they are rainty seen enywhere except in rural areas under the RAND plan (Rural Area Network Design). Basically, plants using these extra facilities are similar to F1/F2 plants, except there are extra cable spans and/or terminatis in the path. When locating cables, the highest numbered facility will be at the end of the path, terminating near the subscriber's end (Rice a 'normal"

of 50 pairs or greater, with a length of ment. This is usually seen on cable routes used in a "feeder-in, feeder-out" errange-F2), and the towest numbered facility will access a pair, just use the last 9.41 in the connected as one way to the switching part terminal blocks the top has switching the feeder path, labelled RAI-A and RAI-B longer than 30 kit (about 6 miles). In this Raral Area Interface (RAI), which can be access technicals. One such facility is the extra distribution cable with separate cable between, like an intermediate feeder or be the feeder from the CO (fike a "normal" termina's on top of the jumper plugs conber, or (eighh) ANI, there should be test locate the pair using color code, 89 numcan also access it at RAI-A! As a terminal block and there may be some (and then F1) CP number from LAC using these pairs, you must either get an F2 levassignment data) corresponds to a this closure, the F2 BP number (cabblock is. Since the F2 pair terminates in sort of loading coil as well. The cable and aluminum frame). Inside the case, there is dosure is a thick neeprene cover ever an this cold are not openable, but the terminal teners on the bottom and/or the sides (the and lifting either the whole cover or the front panel after removing the cover fasterminal dosure is opened by puting out the pole down to the subscriber's site. The wires are strung via strain relief clamps on nal through holes on the bottom. These binding posts, and the wires exit the termi drop wires are then connected to these terminal block inside the closure. Accest

branch splices for aerial cables, so you may see one cable in and two out; also, the prosure can be used for splicing only, so there may not be drop wires (in this case, it wont be talled in LMOS because it is not a terminal point). There is generally one of these every pole near a guad of houses or so, mounted on the cable about an arm's length from the pole.

terminal is common at the first pole on a nearest the terminal (just as before). This numbers. The TEA will be the address is the F2 lennings, and the numbered binding posts and holes correspond to \$2 8,9 holes in the back for aerial drop wires. can hande from 25 to 50 pairs, with 32 won't have to worry about it (especially so if locks in the open position and you Just as in the Ready Access Closure, this enough of a problem). The terminal block nice because hanging onld a pole is slides down on its hinges when opened much smaller; it is opened using a 7/16' similar to that of a 40-type cabinet, but it's be opened or closed. In this way, the door that the door must be Itted before it can bool in the same manner as belone, except gular, and silver (unpainted). The door is pole). It is about 22"H x 6"W x 4"D, rectanthe span close to where it touches the from the terminel block and is spliced onto in the cabinet (rather, a cable stub comes the cable, so there is no F2 spricing area aerial cable. It is not connected in line with on the pole, about a foot down from the al pairs). This terminal is arounted directly used in situations where there are more than 4 houses (8 lines, including provision-49-type just described, except they are ferminals serve the same function as the Type 2: Both the S3A4 and the Naype

GETTING DIRTY.

street, on cut-de-sacs, apartments, marinas, and harbors, or anywhere there are many drop wires.

Buried Distribution Cross Box and Other Pedestals

and off the rest of the closure. These termust be loosened with a 7/16 fiex wrench; either side halfway down the pedestal one of these pedestats, the two bolts on west-high square poles). In order to open and they don't have doors (they look like smallest pedestals in the distribution plant, green like SAI cabinets. These are the respectively, and they are painted grayaround 50" tall by 4, 6, or 12" square minals. Probably the most common cross cable assignment for this terminal will be areas with a buried distribution plant. This as the aerial obsures, except if is used in to the subscribers. will enter as a cable stub, and it is split into more common as the new housing tracts usually) on the ground, often near other groups of houses (up to about 12 lines minals are located generally rear small boxes are the PC4, 6, and 12; these are service wires which go back underground transformers, etc.). These are becoming utility cabinets (such as electric power then the front cover can be fitted up, out, the F2 terminal, and the BP numbers and use buried distribution plant. The F2 cable TEA will be the same as for the ascial ter-This terminal serves the same function

All small pedestals are not necessarily the above type of terminal; these pedestal closures are often used for other purposes, such as splicing points in underground distribution, leading point mounting, and even temporary wire storage containers. If the terminal pontains a terminal block or it

went up to an Natype closure on a pole which are hung on a bar in the pedestal splicing point (just a bunch of pairs conand it was at the right TEA; however, shere a small PC12-type closure on the ground it will be listed in LMC/S. An example of is a significent point on the line, however pair in the splice. Anyway, the whole Fit instead, a color code was listed for the closure), so LMQS had no BP number nected with Scatchlok plastic connectors was no ferminal block because it was a F1 cable. It was fisled as the F1 terminal was serving as a terminal point for a whole mear a street in a rempte suburb, and it this is a distribution path found by Mark and was spit into drop wires. Tabas in a Mountain Bell area -- there was

wire to the block, and often the inside wire trace either the service wire or the inside of the other. The service or drop wire usuuses a block of metal clips; the wire is scriber's building (hotels, businesses, over to the Inside Wire (IW) in the subside will be numbered or labelled with an locate a pair, usually you can visually is connected to the far right. In order to ally enters on the left, and the inside wire each row group terminates one part two have from two to over six clips each. Since divided into honzontal rows which can pushed onto the clip with a punch-down Electric 66 block. The 66-type terminal etc.). There are many different types of rows are needed for x-connect, one on top tool which also strips the wire. The block is by far the most common is the Western tertifical Blocks for this terminal, although service wires and cross-connects them Multi-Line Building Entrance Terminals This terminal takes the aerial drop or

fessional and the amakeur lineman. Basically, it is a customized portable telephone which is designed to be hocked onto raw cable terminals in the field and used to monitor the line, talk, or dial out. The monitor function is usually the main difference between the "butt-in" test set and the normal phone. If you don't have a real test set already, the following circuit can convert a normal \$4 made-in. Taiwan phone into a working test set. The "attin-one" handset units without bases are the best {I tend to like QUIKs and GTE Flip Phone ITs}.

on any other switch). However, you will be sory ferrod on ESS or close the line relay able to sitently monitor all audio on the amount necessary to saturate the superviless than 4 mA nominally (far below the cap blocks DC, and the resistor passes receive dial tone, due to the fact that the switchhook on the test set, you will not the telephone circuit. When you lift the longer shunted, and they become part of opened, the resistor and capacitor are no and receive calls. When the SPST is line you are on. You will be able to dial out "test set" phone, you will get a dial tone as mode; when you lift the switchhook on the il you were a standard extension of the When SPST is closed, you are in talk

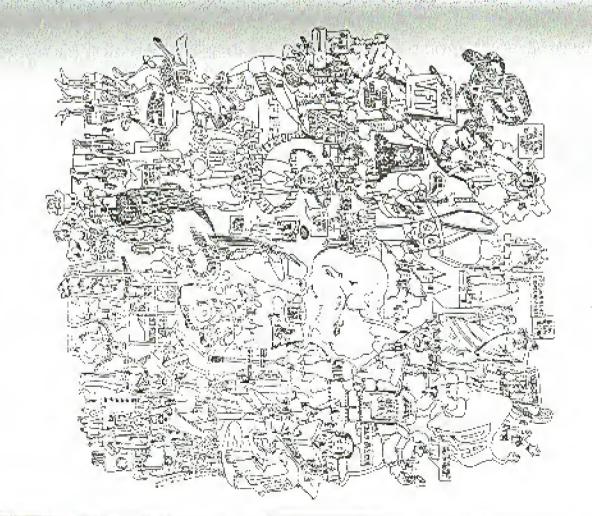

line. The cap readspose plus the phone's impedance ensure that you won't cut the signal too much on the phone line, which might cause a noticeable change (expedite the shock force, someone's on my line!!). It's also good to have a VOM handy when working outside to rapidly check for active lines or supervision states. Also, you can buy test equipment from these companies:

Techni Tool, 5 Apollo Road, Bex 368 Plymouth Maeting, PA 19462.

Specialized Products Company, 2117 W. Walnut Hill Lane, living, TX 75229.

Tam not going to include a disclaimer, because a fine communications hobbyist does not abuse not does he tamper with something he doesn't under- stand. This article is intended as a reference guide for responsible people.

Also, this article was written mainly from first-hand experience and information gained from maintenance technicians, test beards, as well as technical titerature, so it is as accurate as possible. Keep in mind that it is mainly centered upon the area served by Pacific Telephone, so there may be some differences in the loop plant of your area.

owner can then call the machine and give it commands.

Again; there's a big problem here. All someone has to do is call and hang up, this time only once. If nobody picks up the phone at the other number, call forwarding is cancelled, which may not be desired.

Both of these inventions are good ideas. But without decent security, they could be real disasters for the consumer. Imagine having all of your calls forwarded to some remote place where a tape recording could give out false information about you or your business. And the real clincher is the fact that you'd have to pay for those calls!

Sysop Sued Over Email

An Indiana BBS operator is being sued by a user who claims that he intentionally disclosed her private electronic mail to others without her permission.

The lawsuit makes reference to the Electronic Communications Privacy Act of 1986, which makes disclosure of private electronic mail without consent of the sender or the recipiont a federal crime.

Sysops are not by law required to offer private electronic mail to its users. But in cases where they do, the ECPA can be used against them if they don't keep private mail private.

This is what we've been wait-

ing for. Finally, ordinary BRS users are retting something out of the ECPA, which never really seemed designed to protect the

This is a first step towards assuring privacy from the snooping eyes of authority. It won't be so cary to expect a system operator to know every message on his/her system, much less assume responsibility for thom.

Our own bulletin boards, as always, will provide private mail features for users. We don't read or disclose private messages; in fact, our software won't even permit it. We hope this lawsuit will encourage other sysops to adopt this practice and discourage law enforcement from violating our right to privacy.

Dial-It Info Numbers

At long last, New York Telephone has come out with a guide to all of those new mass announcement numbers.

Dialing 540-INFO (toll-free) will get you a list of all 540 interactive services, as well as all of the 976 passive announcement numbers. Dialing 970-INFO gets you a list of all of the adult services (really funny to hear) and 550-INFO will generate a list of the conference numbers. To get a physical list, dial 800-942-1818, operator 976.

If anyone gets this to work outside of New York, let us know.

LETTERS

(continued from page 27)

Too bad, you lose, I am a telecom tech at a large centrex customer of Pac Bell factually, a management position), We are such a good customer that I can call the CO and get them to do anything. They do it because we are such a good customer. Not because I the and tell stories like some do.

That hoped to share some of this information and my 40+ years of experience with others, but I am not going to waste my time to learn your BBS.

I was a writer for TAP and know the whole stery of what happened. Would like to share this also -- but your datun BBS pisses me off!

I also have a patent in telephony and a manufacturing company that makes telephone stuff under the patent.

Whenever you get a normal BBS, let on know and maybe I will change my mind.

Boy, it sure feels good to write this letter:

Am in San Francisco today to tour Pacific Bell's San Ranton complex. I am their guest. They pick are up at my hotel and give me lunch and a tour. This is because I am a good customer of theirs and I am designing the telecommunications facilities for a \$44 million building going up in the

next two years.

See what you massed!
Boy, it even feels better now.
Change those BBS's!

Sorry I can't leave you my name. I am somewhat well known in the field and information I provide must not have my name on it.

We enjoyed your letter very much. We can certainly see how you managed to become so well known. And, no doubt, using your name would not be a good riea, in this or any co-cumstance. But we do want to thank you for finding time in your busy schedule to convey your concerns.

Unfortunately, no one here has any idea on what you could be talking about. We operate four BBS's, each in ming on completely different software. You seem to have had a run-in with one of them. Why don't you tell us exactly what lumpened so we can do something about 12?

Questions

Dear 2600:

For starters I would like to say that this is the best magazine I ever laid hands on, I like the professional way you look at everything. In your November 87 issue the aid that Consumertronics put in was fired for me because I found a file on getting the some fake

The people who advertise in 2600 speak for themselves and not us. Therefore, you'll have to ask them what they mean. Our policy is to accept advertising from anyone unless it makes us violently ill or we know that the people are crooks.

We will be printing phone lists of all kinds of systems as we get them in.

Another Scam

Dear 2600:

I am writing you to pass along some information, and to ask the readers of 2600 about any experiences they may have had with a company called "Mutual Telecommunications Network, Inc.". My first experience: with them was in November 1987. They put an ad in my local paper for "computer syop". The basic idea was as follows: They send you "81,200.00" worth of circuit boards, moderns, software, etc.

You install it, and let them use your phone from 9 am to 9 pm, 7 days a week. After 9 pm, you prepare the data obtained that day for transmission to the company's computer(s). The company in turn pays you an hourly rate of \$3.57 per hour, per day that your system (IBM PC compatible only) is up and running, up to a maximum of \$300.00 per week.

would disqualify me was my thing I could think of that up for this 'hot deal'. unwillingness to shell out for over five years. The only administrator for UNIX and qualified". I am a system me. Thaving found others more Angeles address. They rejected the letter back to the Florida \$660,000 in a hurry just to sign been involved with computers MS-DOS systems, and have got back a response from a Los \$660,00 security deposit, 1 sent that I did not want to pay the stupidly enough, the personal and the agreement, including, address on the envelope, and indicated on the application financial information. Thanks for passing this along.

Anti-Gay Offensive

Your nodding attention to the gay conference line com-

LETTERS

ment "(kill 'em!!)" in 2600, Volume 5, Number 2 is hardly appropriate. Most publications reserve the right to edit or to refuse to print material as objectionable as that. So I can't take your vaguely moral, "face-the-fact" disclaimer very sertously. Do you really think you've done anybody a service by reprinting that item, with or without a disclaimer?

only to the gay community, but also to users of computers, telephones, and 800 numbers everywhere.

CH

OHIO

We do not believe in coverups. By not printing that bit of ugliness, we would have been

doing just that. The fact of the matter is, that comment was already on BBS's all over the country. Perhaps you misunderstood. We did not comprise that list ourselves — it was taken off of a board.

If a public figure made a racist remark, would you blame the local newspaper for printing it? Would you expect them to pretend it didn't happen? Ractsm and its assorted relatives thrive when people by to deny their existence. Computer hackers are not immune from any of this. We can only hope that they, along with most of the others in the world, will look for injustice and scream about it when they find it.

2600

I-SHIRTS

No, we're not kidding. On the front, you'll find an impressive masthead, with the 2600 title visible for very long distances. And on the back, you'll be displaying a collection of news clippings about phreaking and hacking from newspapers all over the world! A great conversation starter on supermarket check-out lines!

Let the world know how enlightened you really are.
